

Care Instructions

Dear Customer,

Many thanks for your interest in the innovative CLEANBAKE-Products!

The CLEANBAKE-Process uses a textile technology to reduce the formation of mould, mildew spots and contamination.

Your CLEANBAKE-Product should facilitate your production process and should make a contribution to the creation of a working environment that is as hygienic, clean and healthy as possible.

However, the technology does not replace the standard practices and regulations with regard to caring for machinery, devices and cloths.

In order to ensure that your CLEANBAKE-Products have a long lifespan, please note the following care instructions:

- 1** Please **wash** your new CLEANBAKE-Products before use.
- 2** **Cotton and blended fabrics** may shrink by up to 4% when washing, and polyester cloths by up to 3%. Please consider this when placing your order – **Your sales advisor will be happy to assist you in this regard.**
- 3** Wash CLEANBAKE-Products in the washing machine at 40° C using **normal detergent. Fabric softeners and bleach must not be used** under any circumstances (washing at up to 90° C is possible but not necessary!).
- 4** Functionality is ensured after washing by applying **intense heat** and this also reactivates the non-stick finish:
 - E.g. by means of **ironing or the use of a rotary iron**
 - Or using the **residual heat** (approx. 150° C) of an **oven** that has been switched off, in which you can place the products for a few minutes.
- 5** Should **dough residues** remain on the cloths during use, please gently **shake** or **brush** these off with a soft brush prior to continuing use.
- 6** CLEANBAKE-Products can withstand temperatures ranging from **-25° C to +170° C.**
